# Increase of safety and reliability of LIBs

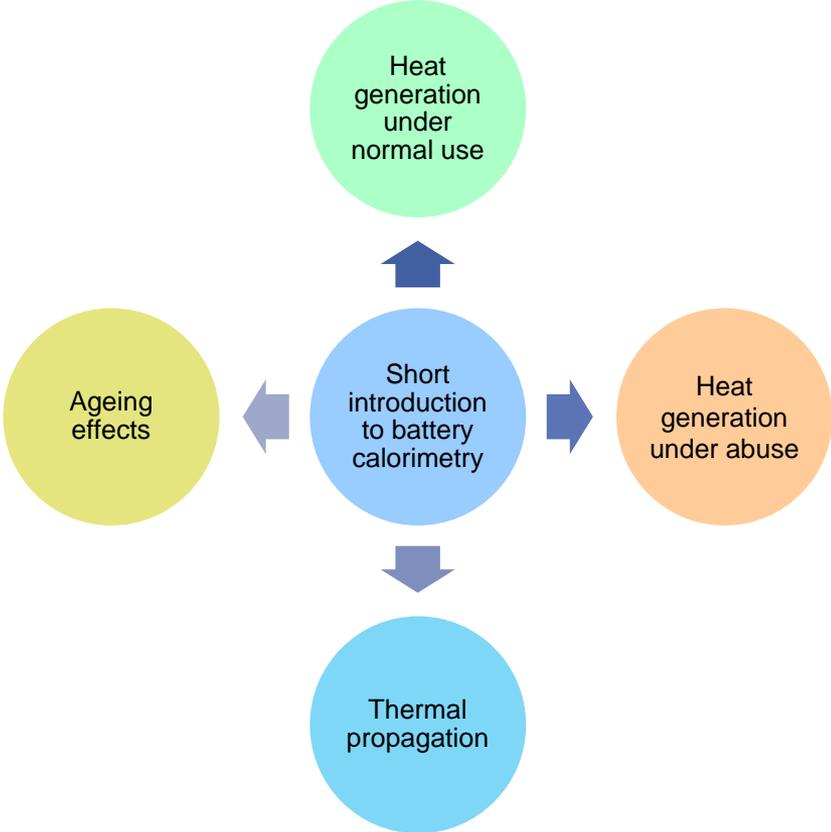

Feng et al., Energy Storage Materials 10 (2018) 246

→ For improving battery management system (BMS) and thermal management system (TMS) electrochemical and thermal behavior of the cells have to be thoroughly studied

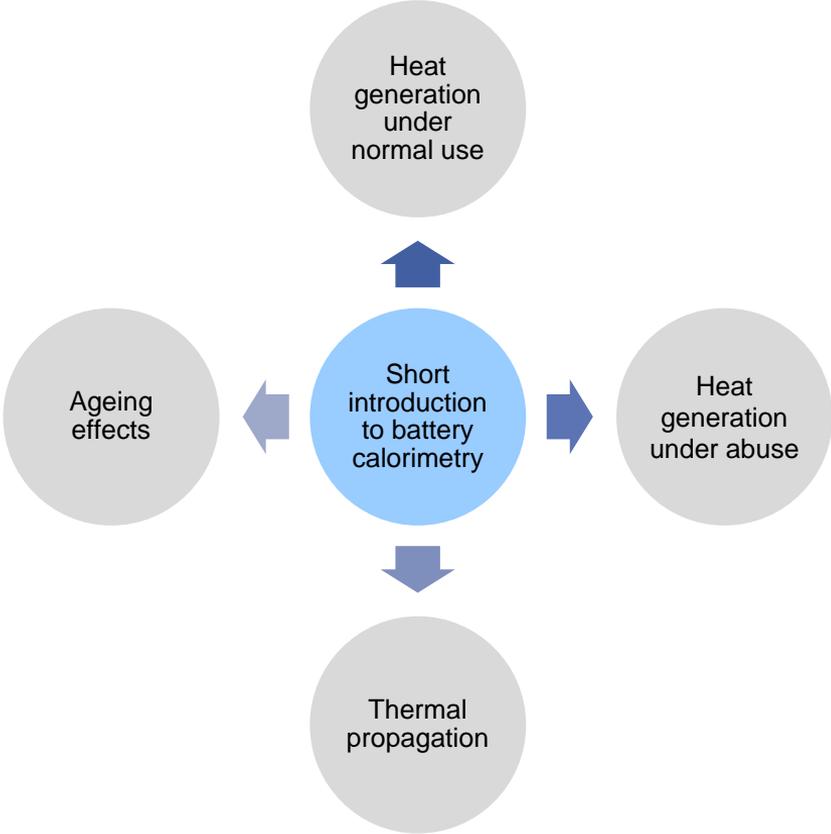

**Aim: Improvement of TMS and BMS by determination of quantitative data of thermal properties using calorimeters**

# Overview

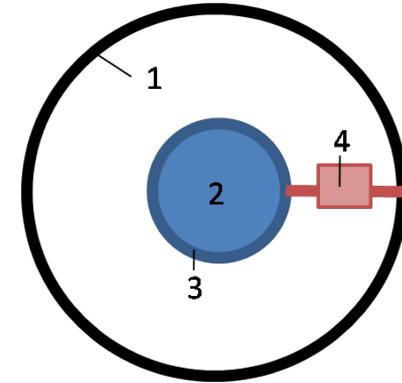

# Overview

# Short introduction to battery calorimetry

## Types of calorimeters

- Isoperibolic calorimeter  
Measurement of the temperature change  $T_s = T(t)$   
 $T_c = \text{constant}$ ,  $R_{th}$  is defined
- Isothermal calorimeter (ice calorimeter of Bunsen)  
 $T_s = T_c = \text{constant}$ ,  $R_{th}$  is very small
- Adiabatic calorimeter  
Variation of the heat supply to the calorimeter  
 $T_s = T_c \neq \text{constant}$ ,  $R_{th} = \infty$
- Tian Calvet heat flux calorimeter  $T_s - T_c = \text{constant}$

- 1 Calorimeter wall
- 2 Sample
- 3 Container
- 4 Thermal resistance  $R_{th}$

$T_s = \text{Sample temperature}$

$T_c = \text{Temperature of the calorimeter walls}$

# At IAM-AWP: Europe`s Largest Calorimeter Center

3 EV+ ARC: Ø: 40 cm  
h: 44 cm

2 ES-ARC: Ø: 10 cm h: 10 cm      2 EV-ARC: Ø: 25 cm h: 50 cm

Equipment: 7 Accelerating rate calorimeters (ARC); 2 Tian-Calvet calorimeters; 5 DSC; IR camera; 13 Temperature chambers (23l - 400 l; -40°C to 180°C); 11 Cyclers (210 channels, 0.01-800 A); EIS; 2 GC/MS

# How can calorimetry help in battery research?

## Research for improving performance parameters

- Higher energy or power density
- Smaller heat release during operation
- Faster charging rates
- Increased cycle life and thermal life

## Research for improving safety parameters

- Higher safe operating temperature
- Better resistance to thermal/mechanical/electrical abuse
- Less energy release during decomposition

*Tian-Calvet calorimeters*

*Isothermal coin cell calorimeter*

*Medium-size ARC*

*Pressure measurement in ARC*

*Large-size ARC*

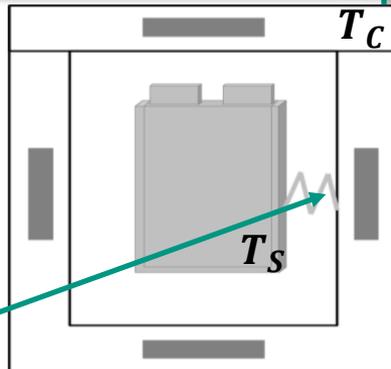

*Nail penetration test in ARC*

# Possible conditions in an ARC

An ARC provides **isoperibolic** and **adiabatic** conditions

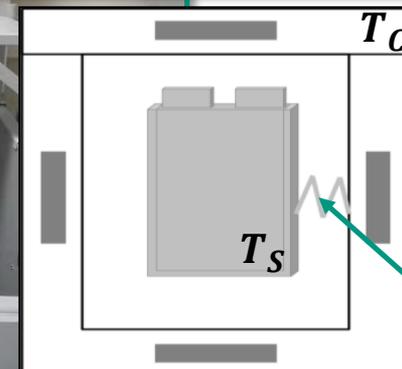

Under isoperibolic conditions the environmental temperature is kept constant.

Under adiabatic conditions the heaters follow immediately any change of the bomb thermocouple thus preventing that the cell can transfer heat to the walls.

$T_C$  constant

$$T_S(t) = T_{S_0} + \alpha \cdot t$$

$$\begin{aligned} T_C &= T_C(t) \\ &= T_{C_0} + \alpha \cdot t \end{aligned}$$

# Cells types to be investigated in calorimeters

## Coin cells

## Cylindrical cells, e.g. 18650, 21700

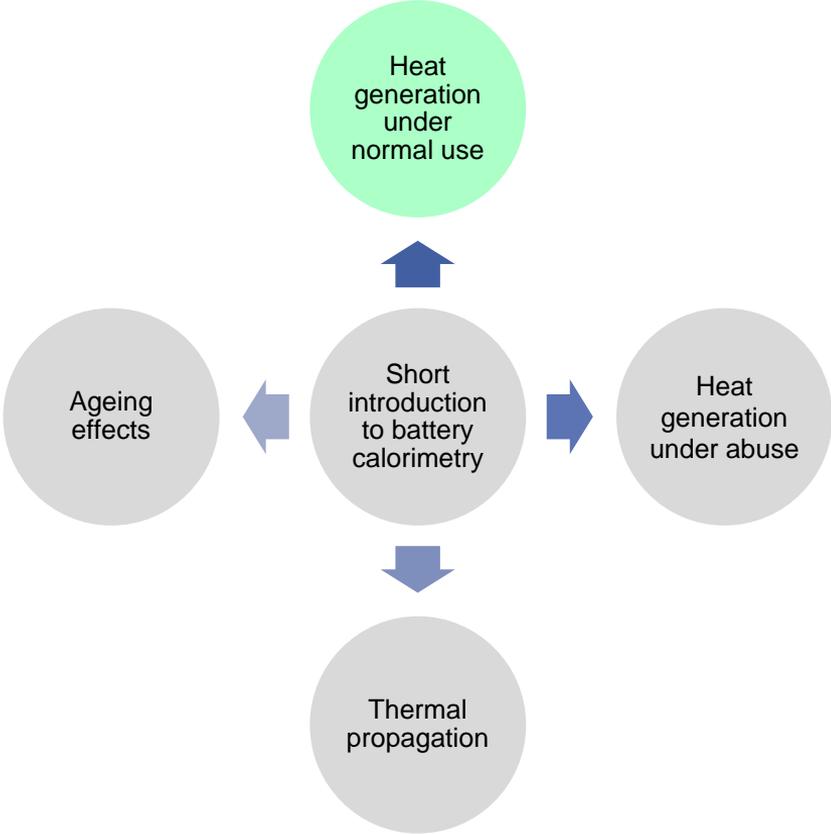

## Prismatic cells

## Pouch cells

# Overview

# Adiabatic Measurements

## Worst Case Conditions

→ Cell in a pack surrounded by other cells

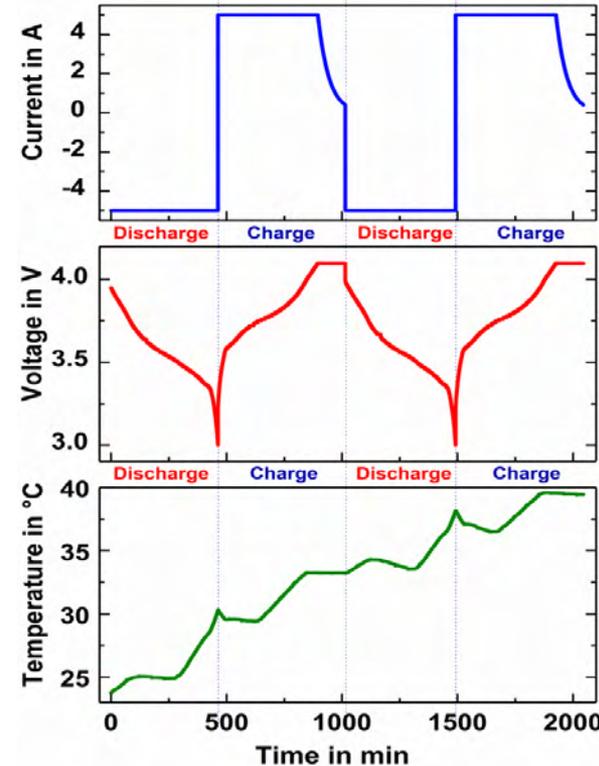

### Discharge parameter:

- method: constant current (CC)
- $U_{\min} = 3.0\text{V}$
- $I = 5\text{A} \rightarrow \text{C}/8\text{-rate}$

### Charge parameter:

- method: constant current, constant voltage (CCCV)
- $U_{\max} = 4.1\text{V}$
- $I = 5\text{A} \rightarrow \text{C}/8\text{-rate}$
- $I_{\min} = 0.5\text{A}$

→ after each electrochemical cycle the cell temperature increases further

40 Ah pouch cell

$T_{\text{st}} = 23^\circ\text{C}$  (RT)

# Isoperibolic measurements

*Ideal conditions*

→ *Single cell*

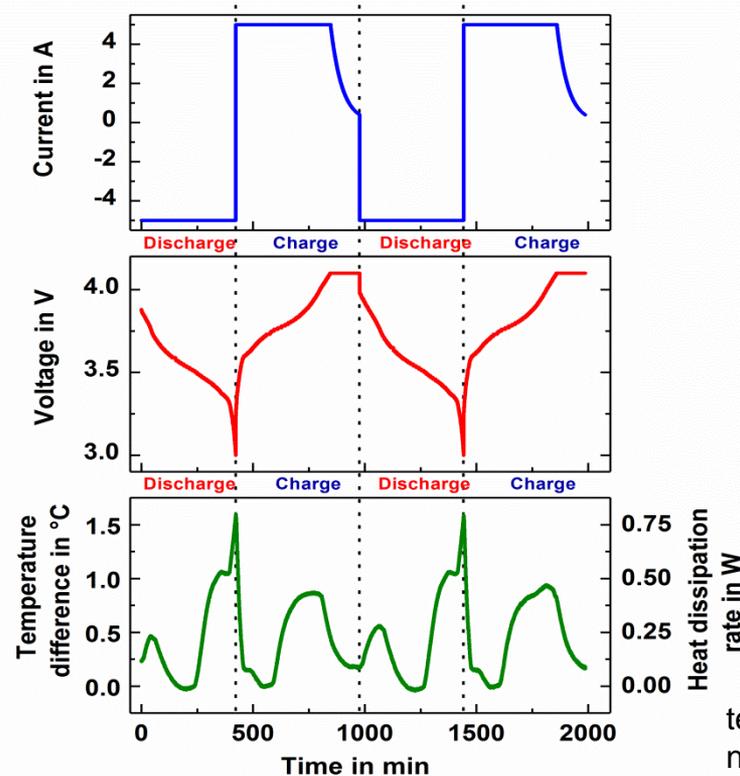

**Discharge parameter:**

- method: constant current (CC)
- $U_{\min} = 3.0\text{V}$
- $I = 5\text{A} \rightarrow \text{C}/8\text{-rate}$

**Charge parameter:**

- method: constant current, constant voltage (CCCV)
- $U_{\max} = 4.1\text{V}$
- $I = 5\text{A} \rightarrow \text{C}/8\text{-rate}$
- $I_{\min} = 0.5\text{A}$

→ after one electrochemical cycle the cell temperature reaches its initial value again

40 Ah pouch cell

$$\left(\frac{\delta E}{\delta T}\right) < 0$$

temperature coefficient negative!

# Determination of total generated heat

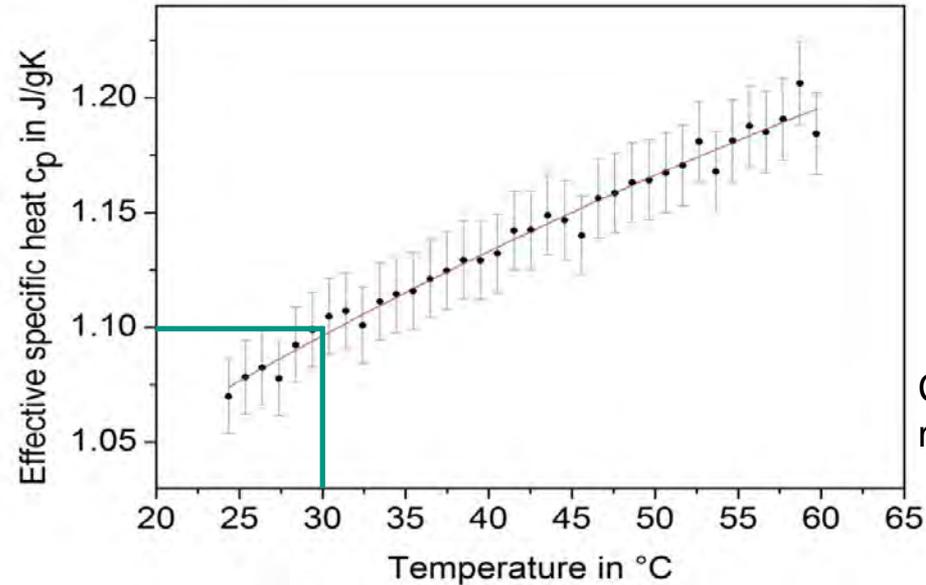

## Heat generation of the cell during charging and discharging – Key data for thermal management and safety

Conversion of thermal data (temperature, temperature rate) to heat (Joule) and power (Watt) with the aim of understanding of heat release to determine heat removal requirements for thermal management.

To be measured:

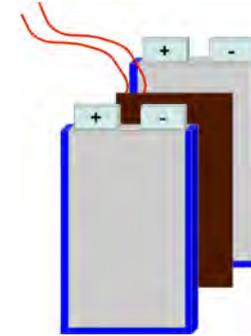

- **Effective specific heat capacity**
- **Heat transfer coefficient**
- **Reversible heat rate and irreversible heat rate**

# Effective specific heat capacity $c_p$

e.g. at 30 °C  $c_p = 1.095 \text{ J/g} \cdot \text{K}$

**Important input data for simulation**

40 Ah pouch cell

Sandwich setup  
for pouch cells

Control of the current applied to the heater  
mat to ensure a constant heating rate

$$c_p = \frac{\Delta Q}{m \cdot \Delta T_{ad}} = \frac{\int U \cdot I dt}{m \cdot \Delta T_{ad}}$$

$m$ : Mass of the cell

$\Delta T_{ad}$ : Temperature difference under  
adiabatic conditions

# Heat transfer coefficient

## Working principle of heat flux sensor (hfs)

*gSKIN®-XP*  
(10mm x 10mm)

Tiny, serially connected semiconductor piles inside the sensor generate a voltage, which is proportional to the heat passing through the surface. The voltage is read out and depending on the sensor's sensitivity the results are converted into the heat flux.

### Sensitivity:

$$S_0 = 10.04 \frac{mV \cdot m^2}{W}$$

*Room temperature sensitivity*

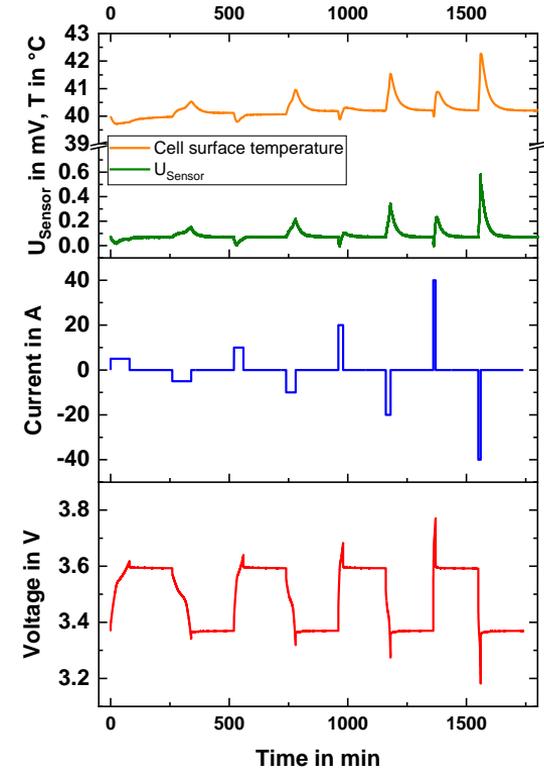

$$\Rightarrow h = \frac{\int \frac{U_{\text{sensor}}}{S(T)} dt}{\int_0^t (T - T_C) dt}$$

<http://shop.greenteg.com/shop/products-rd/gskin-xp/>  
<https://www.greenteg.com/faq-heat-flux-sensing/>

$$S(T) = S_0 + (T - 22.5 \text{ } ^\circ\text{C}) \cdot S_C$$

$$S_C = 0.0049 \cdot \frac{mV \cdot m^2}{W \cdot ^\circ\text{C}}$$

*Temperature correction factor*

# Comparison of values for generated heat

## 1) Adiabatic Measurement

$$\dot{Q}_{gen} = mc_p \frac{dT}{dt}$$

## 2) Isoperibolic Measurement

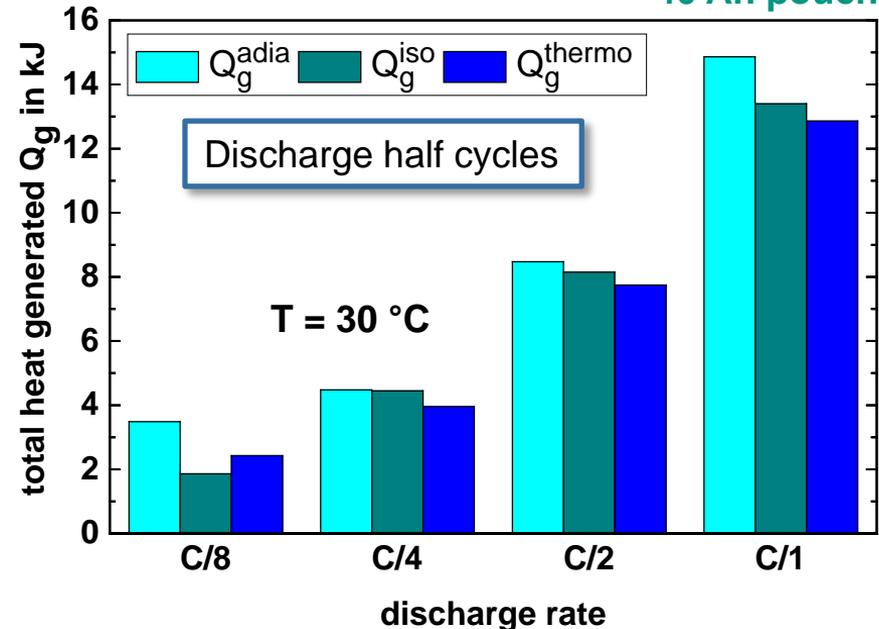

$$\dot{Q}_{gen} = mc_p \frac{dT}{dt} + Ah \cdot (T_S - T_C)$$

## 3) Measurement of irreversible and reversible heat

$$\dot{Q}_{gen} = -I(E_0 - E) - IT \frac{dE_0}{dT}$$

$E_0$ : Open circuit voltage (OCV),  $E$ : cell potential

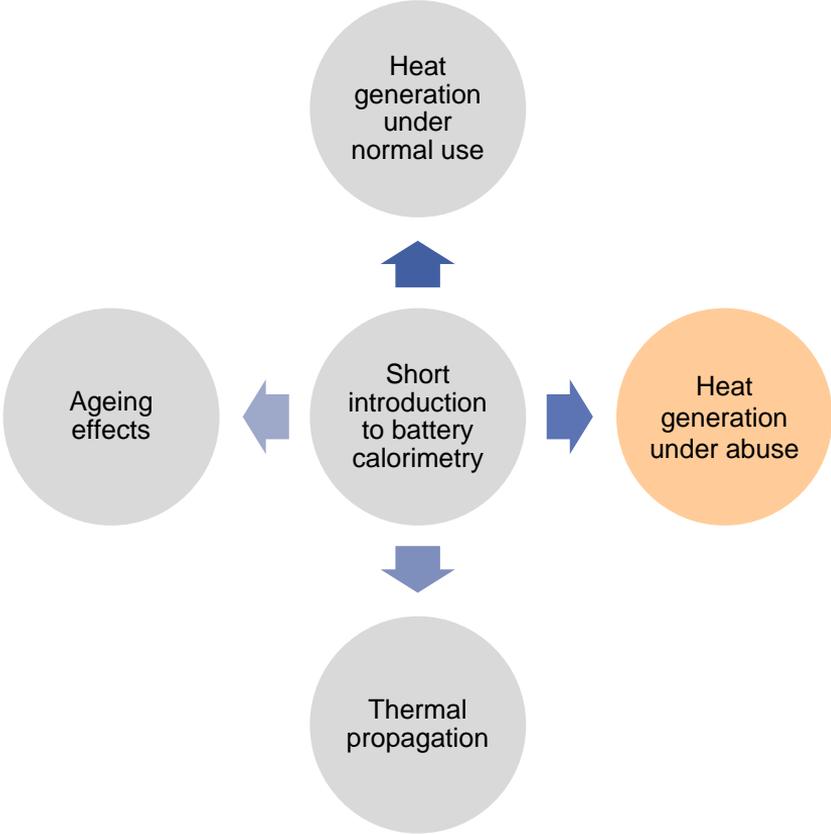

40 Ah pouch cell

**Conclusion: good agreement between the values determined by the different methods**

# Mechanical abuse: Nail penetration test

**Nail penetration test on 10 Ah pouch cell**

# Influence of SOC on thermal runaway

# Influence of SOC on thermal runaway

## SOC 80

$$T_{\max} = 366.24 \text{ }^{\circ}\text{C} \quad T_0 = 24.60 \text{ }^{\circ}\text{C}$$

$$\Delta H = 17.08 \text{ kJ}$$

## SOC 70

$$T_{\max} = 98.13 \text{ }^{\circ}\text{C} \quad T_0 = 23.65 \text{ }^{\circ}\text{C}$$

$$\Delta H = 3.73 \text{ kJ}$$

Heat of reaction  $\Delta H = m \cdot c_p \cdot \Delta T$

$$c_p = 1.0 \text{ J/g K} \quad m = 50.0 \text{ g}$$

**Conclusion: ESC as safety measure in case of mechanical abuse/accident**

# Electrical abuse: Overcharge test (red. pressure)

## Qualitative result on the bench

### Without reduced pressure

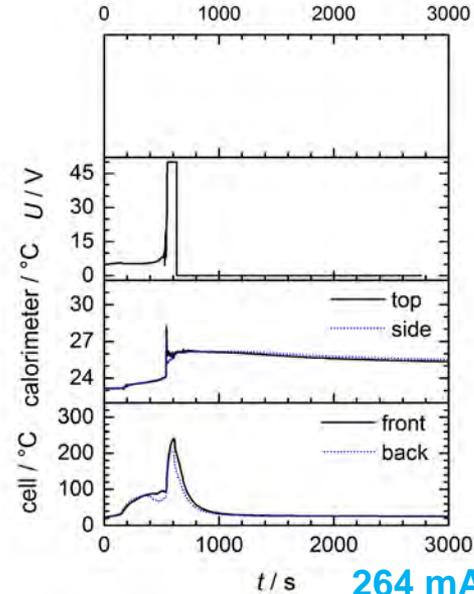

### With reduced pressure

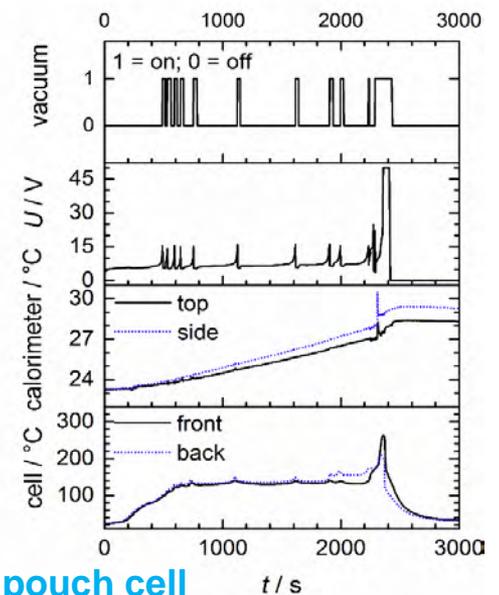

A. Hofmann, N. Uhlmann, C. Ziebert, O. Wiegand, A. Schmidt, Th. Hanemann, *Applied Thermal Engineering*, 124 (2017) 539-544.

## Quantitative result in the ARC

### Without reduced pressure

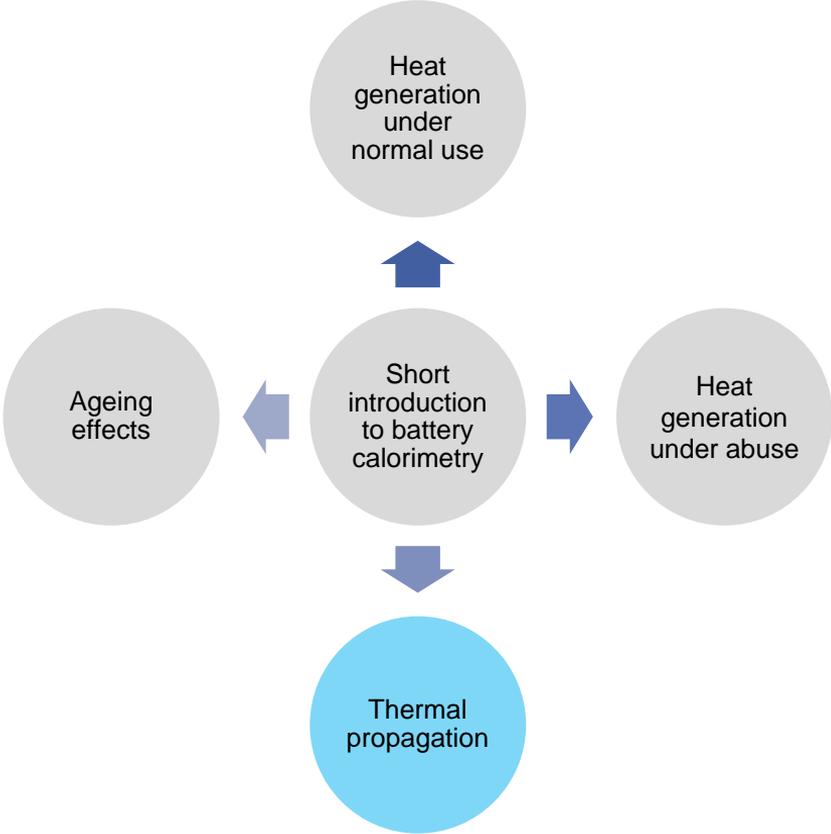

### With reduced pressure

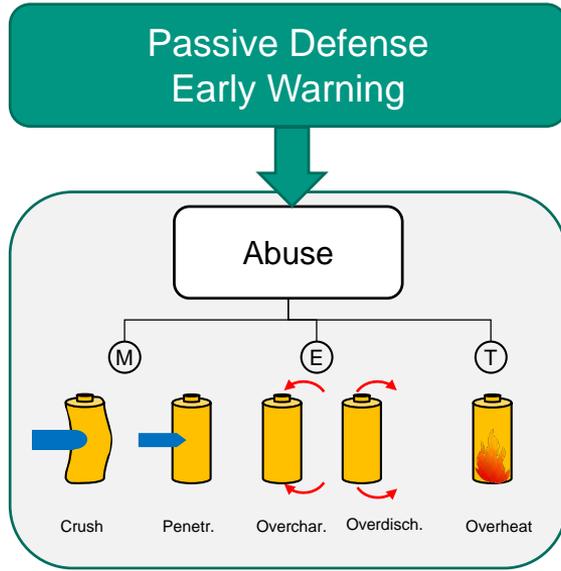

264 mAh pouch cell

**Conclusion: Controlled pressure reduction of pouch cells as safety measure for thermal runaway prevention**

# Overview

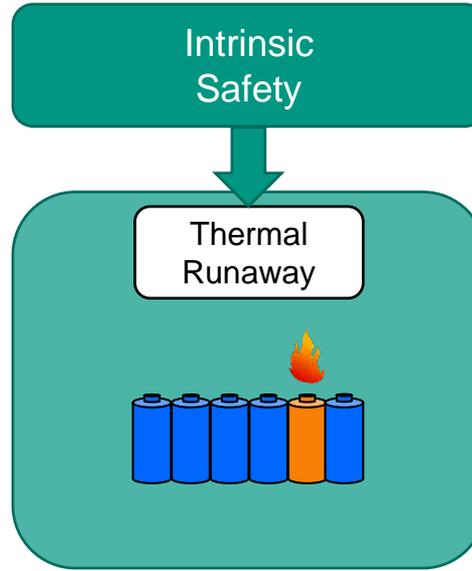

# Thermal propagation

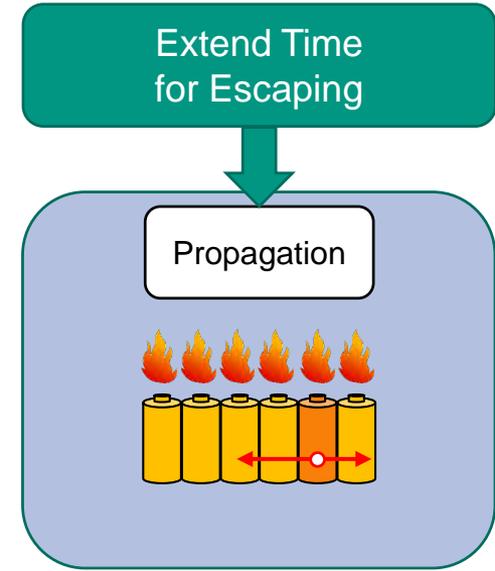

## Step 1 – BMS

Detection of mechanical, electric, thermal abuse

## Step 2 – Cell

Venting, CID, PTC

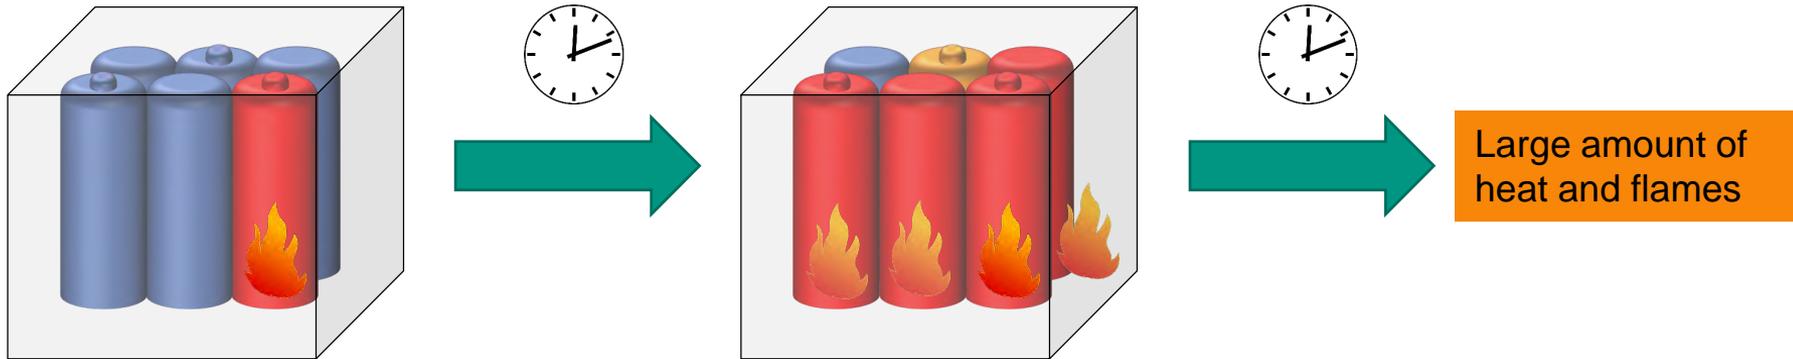

## Step 3 – Pack

Passive propagation prevention

*Adapted from: Feng et al., Energy Storage Materials 10 (2018) 246*

# Thermal Propagation Mitigation

- Safety event like explosion or fire may generate high temperatures up to 800 °C
- Nearby cells in the battery may explode, vent and catch fire shortly after, due to the heat

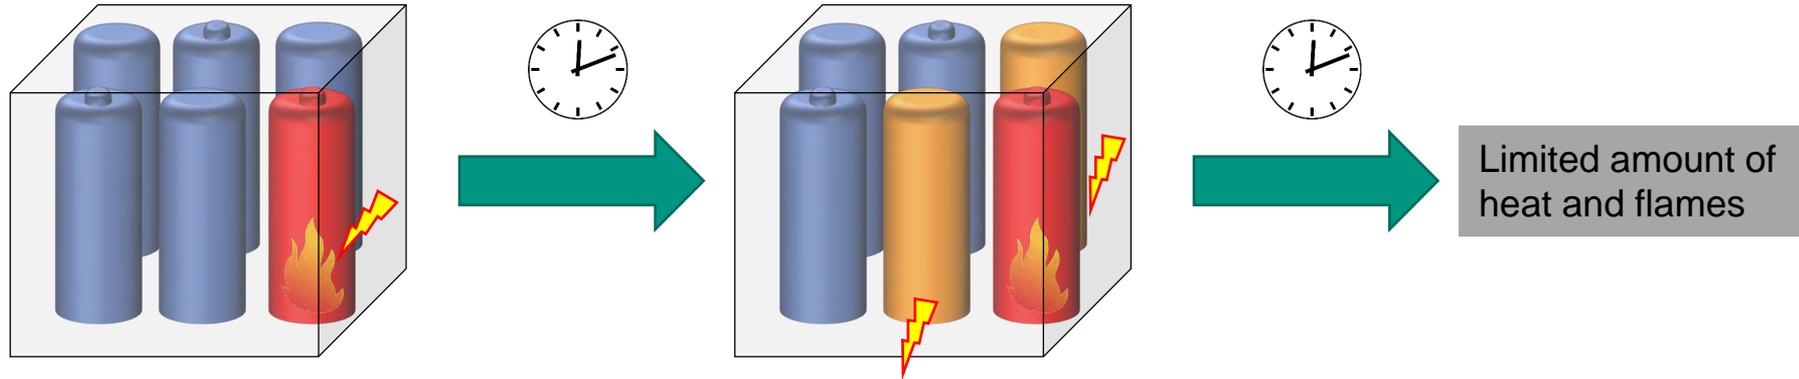

**Safety risk at battery level is much higher than in a single cell**

*Adapted from: S. De-Leon, Lithium Battery Safety Overview Report 2019*

# Thermal Propagation Mitigation

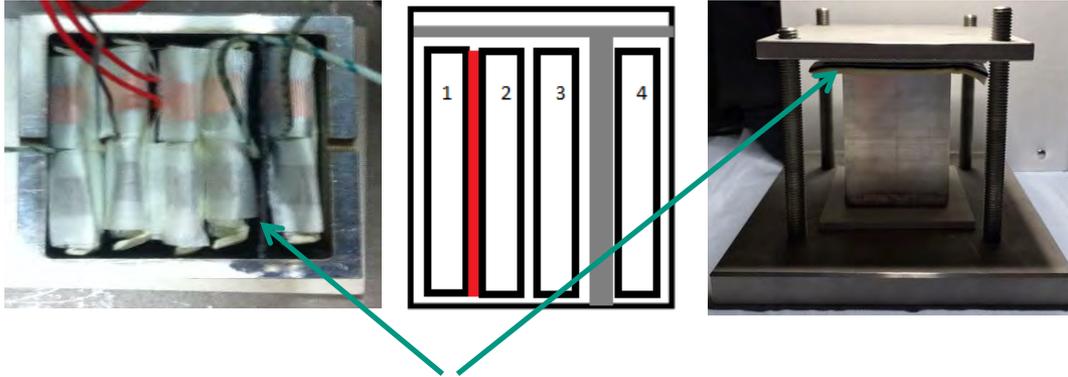

Thermal insulation between cells or batteries can be a sufficient measure to enable the fire extinguishing system to stop or extend the time for thermal propagation

**Ignition and fire → fire extinction and heat evacuation → no propagation**

*Adapted from: S. De-Leon, Lithium Battery Safety Overview Report 2019*

# Thermal propagation tests on small pack level

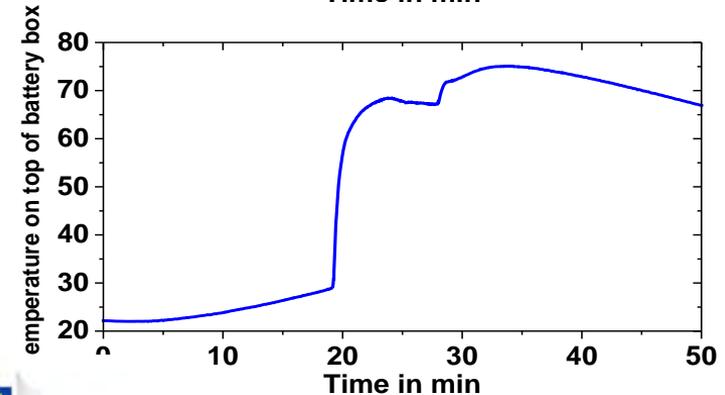

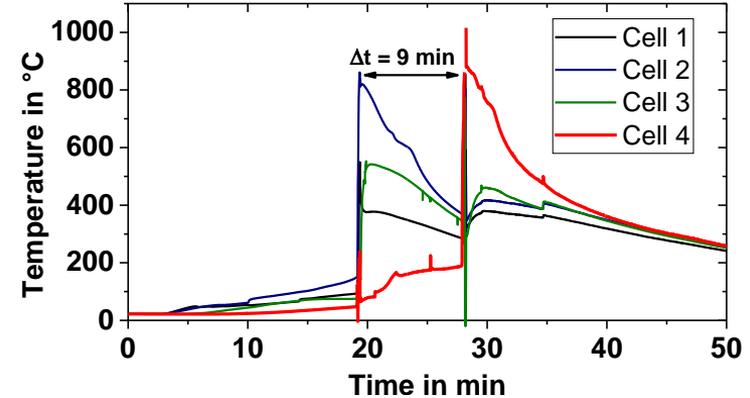

Gray: protective material for cell 4 and lid of battery box  
Red: heater mat for thermal runaway initiation

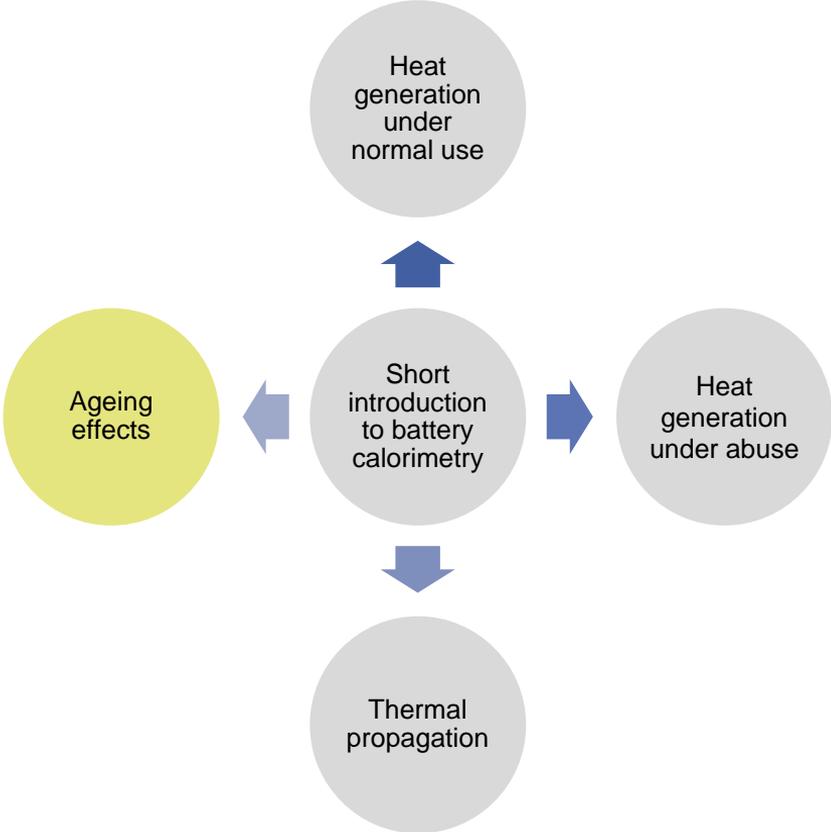

## Material qualification for propagation prevention

### Optimized Multilayer:

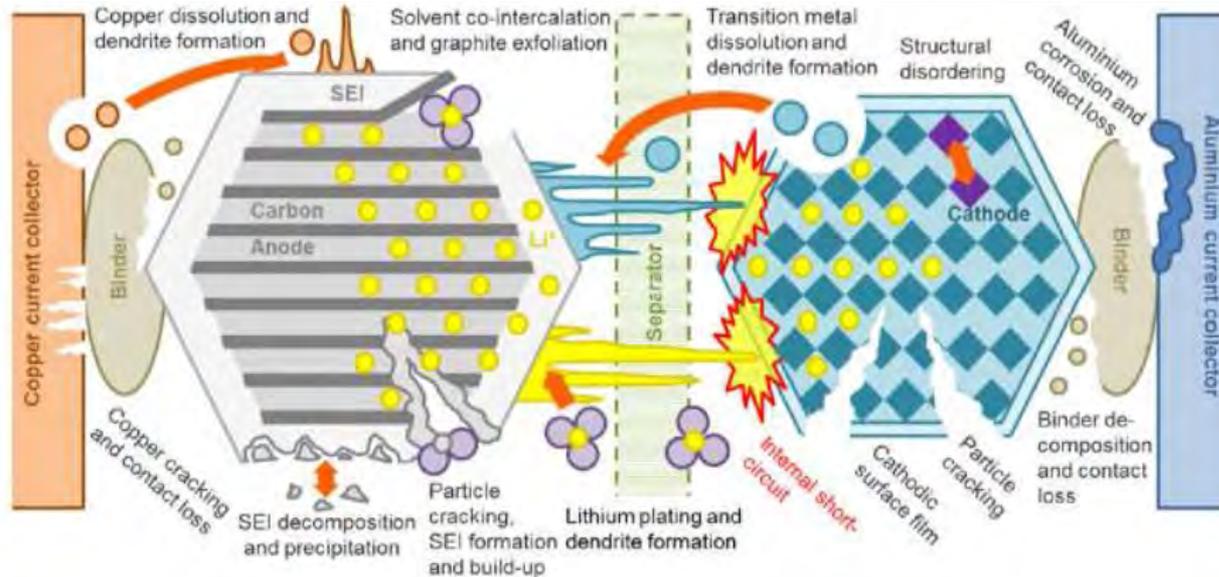

- Extended time for propagation: 9 min
- Improved heat protection: temperature on top of battery box < 80 °C during thermal runaway

# Summary: Possible calorimetric measurements

## Normal use conditions

- Isoperibolic or adiabatic measurements

- For each:**
- Measurement of temperature curve and temperature distribution during cycling (full cycles, or application-specific load profiles), ageing studies
  - Determination of the generated heat, Separation of heat in reversible and irreversible parts

## Abuse conditions

- Thermal abuse: Heat-wait-see test, ramp heating test, thermal propagation test
- External short circuit, nail penetration test
- Overcharge, deep discharge

- For each:**
- Temperature measurement
  - External or internal pressure measurement
  - Gas collection, Post Mortem Analysis, Ageing studies
